```

# **Ternary Search**

Find the smallest i in [a, b] that maximizes f(i), assuming that  $f(a) < \cdots < f(i) \ge \cdots \ge f(b)$ .

If there is a range of  $f(i) \dots f(j)$  that are equal, change according to the comments to get the last index instead of the first.

```

```

#### Distance between point and line

Returns the signed distance from the point p to the line passing through the points a and b.

```
double distPL(ipoint a, ipoint b, ipoint p) {
    return b.cross(p, a) / sqrt((a - b).len2());
} def distPL(a, b, p):
    return cross(b, p, a) / sqrt(dist2(a, b))
}
return cross(b, p, a) / sqrt(dist2(a, b))
```

## Project point to line (or reflect)

Projects the point p onto the line passing through a and b. Set refl=True to get reflection of point p across the line instead.

#### Intersection between two lines

If a unique intersection point of the lines going through s1,e1 and s2,e2 exists (1,point) is returned. If no intersection point exists (0,(0,0)) is returned and if infinitely many exist (-1,(0,0)) is returned.

```
pair<int, dpoint> intersectLL(ipoint s1, ipoint e1,
                                                         def intersectLL(s1, e1, s2, e2):

10 }
```

### Circumcircle

Returns a circle from three points.

#### Circle-polygon area

Returns the area of the intersection of a circle with a counter-clockwise polygon. Time complexity:  $\mathcal{O}(n)$ 

```
double circlePolyArea(dpoint c, double r, vector<dpoint> ps) {
      auto arg = [&](dpoint p, dpoint q) { return atan2(p.cross(q), p.dot(q)); };
      auto tri = [&](dpoint p, dpoint q) {
          double r2 = r * r / 2;
          dpoint d = q - p;
          double a = d.dot(p)/d.len2(), b = (p.len2()-r*r)/d.len2();
          double det = a * a - b;
          if (det <= 0) return arg(p, q) * r2;</pre>
          auto s = max(0., -a-sqrt(det)), t = min(1., -a+sqrt(det));
          if (t < 0 || 1 <= s) return arg(p, q) * r2;</pre>
          dpoint u = p + d * s, v = p + d * t;
11
          return arg(p,u) * r2 + u.cross(v)/2 + arg(v,q) * r2;
12
13
14
      double sum = 0.0;
      for (size_t i = 0; i < ps.size(); i++)</pre>
15
          sum += tri(ps[i] - c, ps[(i + 1) % ps.size()] - c);
16
18 }
```

# **Circle tangents**

Finds the external tangents of two circles, or internal if r2 is negated.

Can return 0, 1, or 2 tangents – 0 if one circle contains the other (or overlaps it, in the internal case, or if the circles are the same); 1 if the circles are tangent to each other (in which case .first = .second and the tangent line is perpendicular to the line between the centers). .first and .second give the tangency points at circle 1 and 2 respectively. To find the tangents of a circle with a point set r2 to 0.

```
vector<pair<dpoint, dpoint>> circleTangents(dpoint
                                                       def circleTangents(c1, r1, c2, r2):
                                                             d = vecsub(c2, c1)

```

#### **Fenwick Tree**

## **Sparse Table**

```
struct SparseTable {
      using T = ll;
      ll n; vector<T> v;
      SparseTable(vector<T> values) : n(values.size()), v(move(values)) {
          ll d = log2(n);
          v.resize((d + 1) * n);
          for (ll L = 0, s = 1; L < d; L++, s *= 2) {
              for (ll i = 0; i < n; i++) {
                  v[node(L + 1, i)] = min(v[node(L, i)], v[node(L, min(i + s, n - 1))]);
              }
11
12
          }
      T query(ll lo, ll hi) { assert(hi > lo);
          ll l = (ll)log2(hi - lo);
return min(v[node(l, lo)], v[node(l, hi - (1 << l))]);</pre>
15
16
17
18 };
```

#### **Lazy Segment Tree**

Segment tree with support for range updates. Use T = pair of value and index to get index from queries.

All ranges are (lo, hi] (hi is not included). fQuery defines the function to be used for queries (currently min) and fUpdate defines the function to be used for updates (currently addition).

```
struct LazyST {
      using T = ll;
      T f(T a, T b) { return min(a, b); }
      static const T QUERY_UNIT = LLONG_MAX; // neutral value for f
      struct Node {
          T val = QUERY_UNIT; // current value of this segment
          optional<T> p; // value being pushed down into this segment
      int len; vector<Node> nodes;
      LazyST(\textbf{int }l) \ : \ len(pow(2,\ ceil(log2(l)))),\ nodes(len\ *\ 2)\ \{\ \}
      void update(int lo, int hi, T val) { u(lo, hi, val, 1, 0, len); }

#### **Line Container**

Container where you can add lines of the form kx + m, and query maximum values at points x. All operations are  $\mathcal{O}(\log(n))$ . For doubles, use inf = 1/.0 and div(a,b) = a/b

```
struct Line {
      mutable ll k, m, p;
      bool operator<(const Line& o) const { return k < o.k; }</pre>
      bool operator<(ll x) const { return p < x; }</pre>
5 };
6 struct LineContainer : multiset<Line, less<>>> {
      const ll inf = LLONG_MAX;
      ll div(ll a, ll b) { // floored division
          return a / b - ((a ^ b) < 0 && a % b);
      bool isect(iterator x, iterator y) {
          if (y == end()) { x->p = inf; return false; }
          if (x->k == y->k) x->p = x->m > y->m ? inf : -inf;
13
          else x->p = div(y->m - x->m, x->k - y->k);
14
15
          return x->p >= y->p;
16
      void add(ll k, ll m) {
17
          auto z = insert(\{k, m, 0\}), y = z++, x = y;
18
          while (isect(y, z)) z = erase(z);
19
          if (x != begin() && isect(--x, y)) isect(x, y = erase(y));
20
          while ((y = x) != begin() \&\& (--x)->p >= y->p) isect(x, erase(y));
21
22
      ll query(ll x) { assert(!empty());
23
24
          auto l = *lower_bound(x);
          return l.k * x + l.m;
25
26
27 };
```

#### **Link Cut Tree**

Represents a forest of unrooted trees. You can add and remove edges (as long as the result is still a forest), and check whether two nodes are in the same tree. All operations are amortized  $\mathcal{O}(\log(n))$ .

```
1 struct Node { // Splay tree. Root's pp contains tree's parent.
      Node *p = 0, *pp = 0, *c[2];
      bool flip = 0;
      Node() { c[0] = c[1] = 0; fix(); }
      void fix() {
          if (c[0]) c[0]->p = this;
          if (c[1]) c[1]->p = this;
          // (+ update sum of subtree elements etc. if wanted)
      void pushFlip() {
10
          if (!flip) return;
11
          flip = 0; swap(c[0], c[1]);
12
          if (c[0]) c[0]->flip ^= 1;
          if (c[1]) c[1]->flip ^= 1;
14
15
      int up() { return p ? p->c[1] == this : -1; }
      void rot(int i, int b) {
17
          int h = i ^ b;
18

87
88 };
```

# **Graph Algorithms**

# Maximum Flow (Dinic's Algorithm)

Constructor takes number of nodes, call addEdge to add edges and calc to find maximum flow. To obtain the actual flow, look at positive values of Edge::cap only.

Time complexity:  $\mathcal{O}(VE \log U)$  where  $U = \max |\text{cap}|$ .  $\mathcal{O}(\min(E^{1/2}, V^{2/3})E)$  if U = 1.  $\mathcal{O}(\sqrt{VE})$  for bipartite matching.

```
struct Dinic {
      struct Edge {
          int to, rev;
          ll c, oc;
          ll flow() { return max(oc - c, 0LL); }
      vector<int> lvl, ptr, q;
      vector<vector<Edge>> adj;
      Dinic(int n) : lvl(n), ptr(n), q(n), adj(n) {}
      void addEdge(int a, int b, ll c, ll rcap = 0) {
          adj[a].push_back({b, (int)adj[b].size(), c, c});
          adj[b].push_back({a, (int)adj[a].size() - 1, rcap, rcap});
12
13
      ll dfs(int v, int t, ll f) {
14
          if (v == t || !f) return f;
          for (int& i = ptr[v]; i < adj[v].size(); i++) {</pre>
16
              Edge& e = adj[v][i];
18
              if (lvl[e.to] == lvl[v] + 1)
                   if (ll p = dfs(e.to, t, min(f, e.c))) {
19
                       e.c -= p, adj[e.to][e.rev].c += p;
                       return p;
21
                   }
          }
23
          return 0;
24
25
      ll calc(int s, int t) {
26
          ll flow = 0; q[0] = s;
          for (int L = 0; L < 31; L++) do { // 'int L=30' maybe faster for random data
28
               lvl = ptr = vector<int>(q.size());

                    nodes[e.b].dist = -inf;
24
25 }
```

# Floyd Warshall

Calculates all-pairs shortest path in a directed graph. As output, m[i][j] is set to the shortest distance between i and j, inf if no path, or -inf if the path goes through a negative-weight cycle. Time complexity:  $\mathcal{O}(N^3)$ .

```
1 from math import inf
2 def floydWarshall(m): # m[i][j] should be inf if i and j are not adjacent
       for i in range(len(m)):
           m[i][i] = min(m[i][i], 0)
      for k in range(len(m)):
           for i in range(len(m)):
               for j in range(len(m)):
                    if m[i][k] != inf and m[k][j] != inf:
                        m[i][j] = min(m[i][j], max(m[i][k] + m[k][j], -inf))
      #only needed if weights can be negative:
      for k in range(len(m)):
           if m[k][k] < 0:
12
               for i in range(len(m)):
                   for j in range(len(m)):
                        if m[i][k] != inf and m[k][j] != inf:
15
                            m[i][j] = -inf
1 const ll inf = 1LL << 62;</pre>
void floydWarshall(vector<vector<ll>>& m) { // m[i][j] should be inf if i and j are not adjacent
      int n = m.size();
      for(int i = 0; i < n; i++)</pre>
           m[i][i] = min(m[i][i], 0LL);
      for(int k = 0; k < n; k++)
           for(int i = 0; i < n; i++)</pre>
               for(int j = 0; j < n; j++)
   if (m[i][k] != inf && m[k][j] != inf)</pre>
                        m[i][j] = min(m[i][j], max(m[i][k] + m[k][j], -inf));
      //only needed if weights can be negative:
11
      for(int k = 0; k < n; k++)</pre>
           if (m[k][k] < 0)
13
               for(int i = 0; i < n; i++)</pre>
                   for(int j = 0; j < n; j++)</pre>
                        if (m[i][k] != inf && m[k][j] != inf)
                            m[i][j] = -inf;
17
18 }
```

#### **Biconnected Components**

Finds all biconnected components in an undirected graph, and returns a list of edges in each. Time complexity:  $\mathcal{O}(E+V)$ . Note that a node can be in several components, and bridges are by default returned as a single-edge biconnected component.

```
struct BCC {
      const vector<vector<ll>>* adj;
      vector<ll> dfsNum;
      ll nnum = 0;
      vector<pair<ll, ll>> st;
      vector<vector<pair<ll, ll>>> bccs;
      ll dfs(ll cur, ll par) {
          ll top = dfsNum[cur] = ++nnum;
          for (ll nxt : (*adj)[cur]) {
               if (nxt == par) continue;
10
               if (dfsNum[nxt]) {
11
                   top = min(top, dfsNum[nxt]);
                   if (dfsNum[nxt] < dfsNum[cur])</pre>
                       st.emplace_back(cur, nxt);
                   continue;
15
              ll si = st.size();
17
               ll up = dfs(nxt, cur);
18
              top = min(top, up);
               if (up == dfsNum[cur]) {
20
                   bccs.emplace_back(st.begin() + si, st.end());
21
                   bccs.back().emplace_back(cur, nxt);
22
                   st.resize(si);
               } else if (up < dfsNum[cur]) {</pre>
24
25
                   st.emplace_back(cur, nxt);
               } else { //the edge (cur,nxt) is a bridge
                   bccs.push_back({make_pair(cur, nxt)}); //remove if bridges should not form BCCs
27
29
          }
          return top;
30
31
32 };
33 vector<vector<pair<ll, ll>>> findBCC(const vector<vector<ll>>& adj) {
      BCC bcc = { &adj, vector<ll>(adj.size()) };
34
35
      for (ll i = 0; i < (ll)adj.size(); i++)</pre>
          if (bcc.dfsNum[i] == 0)
36
              bcc.dfs(i, -1);
37
      return move(bcc.bccs);
38
39 }
```

## **Strongly Connected Components**

Finds strongly connected components in a directed graph. Usage:  $scc(graph, [\&](vector<int>\& v) { ... })}$  visits all components in reverse topological order. comp[i] holds the component index of a node (a component only has edges to components with lower index). ncomps will contain the number of components. Time complexity: O(E + V)

```
vector<int> val, comp, z, cont; int Time, ncomps;
2 template < class G, class F> int dfs(int j, G& g, F& f) {
      int low = val[j] = ++Time, x; z.push_back(j);
      for(auto\& e : g[j]) if (comp[e] < 0)
           low = min(low, val[e] ?: dfs(e,g,f));
      if (low == val[j]) {
          do {
               x = z.back(); z.pop_back();
               comp[x] = ncomps:
               cont.push_back(x);
          } while (x != j);
11
          f(cont); cont.clear();
12
13
          ncomps++;
14
15
      return val[j] = low;
16 }
  template < class G, class F> void scc(G& g, F f) {
18
      val.assign(g.size(), 0);
      comp.assign(g.size(), -1);
19
      Time = ncomps = 0;
      for(size_t i = 0; i < g.size(); i++)</pre>
21
           if (comp[i] < 0) dfs(i, g, f);</pre>
22
23 }
```

#### 2-SAT

1 struct TwoSat {

Calculates a valid assignment to boolean variables in a 2-SAT problem. Negated variables are represented by bit-inversions ( $\sim x$ ). Time complexity:  $\mathcal{O}(N+E)$ , where N is the number of boolean variables, and E is the number of clauses.

```
int N;
      vector<vector<int>> gr;
      vector<int> values; // 0 = false, 1 = true
      TwoSat(int n = 0) : N(n), gr(2 * n) {}
      void either(int f, int j) {
    f = max(2 * f, -1-2*f);
           j = max(2 * j, -1-2*j);
           gr[f].push_back(j ^ 1);
           gr[j].push_back(f ^ 1);
10
      void set_value(int x) { either(x, x); }
12
      vector<int> val, comp, z; int time = 0;
      int dfs(int i) {
           int low = val[i] = ++time, x;
15
           z.push_back(i);
           for(auto& e : gr[i])
17
               if (!comp[e])
18
                   low = min(low, val[e] ?: dfs(e));
           if (low == val[i]) do {
20
               x = z.back(); z.pop_back();
               comp[x] = low;
               if (values[x>>1] == -1)
                   values[x>>1] = x&1;
24
           } while (x != i);
25
           return val[i] = low;
27
      bool solve() {
29
           values.assign(N, −1);
           val.assign(2 * N, 0); comp = val;
30
           for (int i = 0; i < 2 * N; ++i)
31
               if (!comp[i])
                   dfs(i);
           for (int i = 0; i < N; ++i)</pre>
               if (comp[2 * i] == comp[2 * i + 1])
                   return 0;
           return 1;
37
      /* optional */ int add_var() {
39
           gr.emplace_back();
           gr.emplace_back();
41
           return N++;
42
      /* optional */ void at_most_one(const vector<int>& li) {
44
           if (li.size() <= 1) return;</pre>
           int cur = ~li[0];
           for(size_t i = 2; i < li.size(); i++) {</pre>
47
               int next = add_var();
               either(cur, ~li[i]);
either(cur, next);
49
               either(~li[i], next);
               cur = ~next;
53
54
           either(cur, ~li[1]);
      }
56 };
  Usage example:
1 TwoSat ts(number of boolean variables);
2 ts.either(0, ~3); // Var 0 is true or var 3 is false
s ts.set_value(2); // Var 2 is true
4 ts.at_most_one(\{0, \sim 1, 2\}); // <= 1 of vars 0, \sim 1 and 2 are true
s ts.solve(); // Returns true iff it is solvable. ts.values holds the assigned values to the variables
```

## **Minimum Cost Maximum Flow**

Calculates min-cost max-flow. cap[i][j]!=cap[j][i] is allowed; double edges are not. To obtain the actual flow, look at positive values only. Time complexity:  $\mathcal{O}(E^2)$ . If costs can be negative, call setpi before maxflow. Negative cost cycles are not supported.

```
#include <bits/extc++.h>
const ll INF = LLONG_MAX / 4;
3 struct MCMF {
      int N;
      vector<vector<int>> ed, red;
      vector<vector<ll>> cap, flow, cost;
      vector<int> seen;
      vector<ll> dist, pi;
      vector<pair<int, int> > par;
      MCMF(int N) : N(N), ed(N), red(N), cap(N, vector<ll>(N)),
10
          flow(cap), cost(cap), seen(N), dist(N), pi(N), par(N) { }
      void addEdge(int from, int to, ll cap, ll cost) {
12
          this->cap[from][to] = cap;
          this->cost[from][to] = cost;
          ed[from].push back(to);
15
          red[to].push_back(from);
17
      void path(int s) {
18
          fill(all(seen), 0);
19
          fill(all(dist), INF);
20
          dist[s] = 0; ll di;
21
          __gnu_pbds::priority_queue<pair<ll, int>> q;
22
          vector<decltype(q)::point_iterator> its(N);
          q.push({0, s});
24
          auto relax = [&](int i, ll cap, ll cost, int dir) {
25
              ll val = di - pi[i] + cost;
              if (cap && val < dist[i]) {
27
                  dist[i] = val;
                  par[i] = {s, dir};
                   if (its[i] == q.end())
                       its[i] = q.push({-dist[i], i});
                       q.modify(its[i], {-dist[i], i});
              }
34
          };
35
          while (!q.empty()) {
              s = q.top().second; q.pop();
37
              seen[s] = 1;
              di = dist[s] + pi[s];
              for (auto& i : ed[s]) if (!seen[i])
                  relax(i, cap[s][i] - flow[s][i], cost[s][i], 1);
41
              for (auto& i : red[s]) if (!seen[i])
42
                  relax(i, flow[i][s], -cost[i][s], 0);
44
          for(int i = 0; i < N; i++)</pre>
              pi[i] = min(pi[i] + dist[i], INF);
47
      pair<ll, ll> maxflow(int s, int t) {
48
          ll totflow = 0, totcost = 0;
49
          while (path(s), seen[t]) {
              ll fl = INF;
51
               for (int p,r,x = t; tie(p,r) = par[x], x != s; x = p)
                   fl = min(fl, r ? cap[p][x] - flow[p][x] : flow[x][p]);
54
               totflow += fl;

                   if (r) flow[p][x] += fl;
                  else flow[x][p] -= fl;
              }
58
59
          for(int i = 0; i < N; i++)</pre>
              for(int j = 0; j < N; j++)
61
                  totcost += cost[i][j] * flow[i][j];
          return { totflow, totcost };
63
64
      void setpi(int s) { // optional, if some costs can be negative, call this before maxflow
65
          fill(all(pi), INF); pi[s] = 0;
66
          int it = N, ch = 1; ll v;
          while (ch-- && it--)
68
               for(int i = 0; i < N; i++) if (pi[i] != INF)</pre>
```

```
for (auto& to : ed[i]) if (cap[i][to])
if ((v = pi[i] + cost[i][to]) < pi[to])
pi[to] = v, ch = 1;
assert(it >= 0); // negative cost cycle
}

75 };
```

#### **Weighted Bipartite Matching**

Given a weighted bipartite graph, matches every node on the left with a node on the right such that no nodes are in two matchings and the sum of the edge weights is minimal.

Takes cost[N][M], where cost[i][j] = cost for L[i] to be matched with R[j] and returns (min cost, match), where L[i] is matched with R[match[i]]. Negate costs for max cost. Requires  $N \le M$ . Time complexity:  $\mathcal{O}(N^2M)$ 

```
pair<ll, vector<ll>> hungarian(const vector<vector<ll>> &a) {
      if (a.empty()) return {0, {}};
      ll n = a.size() + 1;
      ll m = a[0].size() + 1;
      vector<ll> u(n), v(m), p(m), ans(n - 1);
      for (ll i = 1; i < n; i++) {</pre>
          p[0] = i;
           11 j0 = 0;
          vector<ll> dist(m, LLONG_MAX), pre(m, -1);
          vector<bool> done(m + 1);
          do {
11
               done[j0] = true;
               ll i0 = p[j0], j1, delta = LLONG_MAX;
               for (ll j = 1; j < m; j++) if (!done[j]) {</pre>
                   auto cur = a[i0 - 1][j - 1] - u[i0] - v[j];
                   if (cur < dist[j]) dist[j] = cur, pre[j] = j0;</pre>
                   if (dist[j] < delta) delta = dist[j], j1 = j;</pre>
18
               for (ll j = 0; j < m; j++) {</pre>
                   if (done[j]) u[p[j]] += delta, v[j] -= delta;
                   else dist[j] -= delta;
22
               j0 = j1;
23
          } while (p[j0]);
24
          while (j0) {
              ll j1 = pre[j0];
               p[j0] = p[j1], j0 = j1;
27
28
29
      for (ll j = 1; j < m; j++) if (p[j]) ans[p[j] - 1] = j - 1;
31
      return {-v[0], ans};
32 }
```

# Math

## **Fast Modudo Operations**

```
using ull = unsigned long long;
ull modmul(ull a, ull b, ull M) {
    ll ret = a * b - M * ull(1.L / M * a * b);
    return ret + M * (ret < 0) - M * (ret >= (ll)M);
}
ull modpow(ull b, ull e, ull mod) {
    ull ans = 1;
    for (; e; b = modmul(b, b, mod), e /= 2)
        if (e & 1) ans = modmul(ans, b, mod);
    return ans;
}
```

#### Is Prime (Miller-Rabin)

Guaranteed to work for numbers up to  $7 \cdot 10^{18}$ . For larger numbers, use Python and extend A randomly.

```
#include "modmul.cpp"
                                                            def ctz(x): return (x & -x).bit_length() - 1
2 bool isPrime(ull n) {
                                                            <sup>2</sup> A = [2,325,9375,28178,450775,9780504,1795265022]
                                                            3 def isPrime(n):
      if (n < 2 || n % 6 % 4 != 1)
          return (n | 1) == 3;
                                                                   if n < 2 or n % 6 % 4 != 1:
                                                                       return (n | 1) == 3
      ull s = __builtin_ctzll(n-1);
      for (ull a : {2, 325, 9375, 28178, 450775,
                                                                  s = ctz(n-1)
      → 9780504, 1795265022}) {

```

## **Extended Euclidean Algorithm**

Finds the Greatest Common Divisor to the integers a and b. Also finds two integers x and y, such that  $ax + by = \gcd(a, b)$ . Returns a tuple of  $(\gcd(a, b), x, y)$ . If a and b are coprime, then x is the inverse of  $a \pmod{b}$ .

```
1 ll extEuclid(ll a, ll b, ll& x, ll& y) {
2    if (b) {
3        ll d = extEuclid(b, a % b, y, x);
4        return y -= a / b * x, d;
5    }
6    return x = 1, y = 0, a;
7 }

1 def extEuclid(a, b):
2    if b:
3        d, x, y = extEuclid(b, a % b)
4        return (d, y, x - a // b * y)
5    return (a, 1, 0)
```

#### **Chinese Remainder Theorem**

Finds the smallest number x satisfying a system of congruences, each in the form  $x \equiv r_i \pmod{m_i}$ . All pairs of  $m_i$  must be coprime. eq is a list of tuples describing the equations, the i:th of which should be  $(r_i, m_i)$ .

```
1 //no overflow if the product of all eq.second < 2^62 1 def crt(eq):</pre>
2 ll crt(const vector<pair<ll, ll>>& eq) {
                                                                p, res = 1, 0
                                                                for rem, md in eq:
      ll p = 1, res = 0;
      for (auto e : eq) p *= e.second;
                                                                   p *= md
      for (auto e : eq) {
                                                                for rem, md in eq:
          ll pp = p / e.second, ppi, y;
                                                                    pp = p // md
          extEuclid(pp, e.second, ppi, y);
                                                                    res = (res + rem*extEuclid(pp, md)[1]*pp) % p
          res = (res + e.first * ppi * pp) % p;
                                                                return res
      return res;
10
11 }
```

#### **Fraction Binary Search**

```
Given f and N, finds the smallest fraction p/q \in [0,1] such that f(p/q) is true, and p,q \leq N.
struct Frac { ll p, q; };
template < class F> Frac fractionBinarySearch(F f, ll N) {
      bool dir = 1, A = 1, B = 1;
