Misc

Template

```
1  //#pragma GCC optimize("Ofast")
2  #include <bits/stdc++.h>
3  #define all(x) begin(x),end(x)
4  using namespace std;
5  using ll = long long;
6  int main() {
7      ios_base::sync_with_stdio(false);
8      cin.tie(nullptr);
9  }
```

Compilation Script

```
1  #!/bin/bash
2  g++ --std=c++17 -Wall -Wshadow -Wno-conversion -ftrapv -g $1 -o ${1%.cpp}.bin
```

Binary Search

```
1  while (lo < hi) {
2      ll mid = lo + (hi - lo) / 2;
3      if (f(mid)) // f should be false, then true
4          hi = mid;
5      else
6          lo = mid + 1;
7  }
8  //lo is now the first index where f is true
```

Ternary Search

Find the smallest i in $[a, b]$ that maximizes $f(i)$, assuming that $f(a) < \cdots < f(i) \geq \cdots \geq f(b)$.

If there is a range of $f(i) \ldots f(j)$ that are equal, change according to the comments to get the last index instead of the first.

```
1  template<class F>
2  ll ternarySearch(ll a, ll b, F f) {
3      assert(a <= b);
4      while (b - a >= 5) {
5          ll mid = (a + b) / 2;
6          if (f(mid) < f(mid+1)) // <= for last index
7              a = mid;
8          else
9              b = mid+1;
10     }
11     //for (ll i = b; i > a; i--) to get last index
12     for (ll i = a + 1; i <= b; i++)
13         if (f(a) < f(i))
14             a = i;
15     return a;
16 }
```

```
1  def ternarySearch(a, b, f):
2      assert a <= b
3      while b - a >= 5:
4          mid = (a + b) // 2
5          if f(mid) < f(mid+1): # <= for last index
6              a = mid
7          else:
8              b = mid + 1
9      #for i in range(b, a-1, -1): to get last index
10     for i in range(a+1, b+1):
11         if f(a) < f(i):
12             a = i
13     return a
```

Geometry

Geometry Template (Python)

```
1  def vecsub(a, b):
2      return (a[0] - b[0], a[1] - b[1])
3  def vecadd(a, b):
4      return (a[0] + b[0], a[1] + b[1])
5  def dot(a, b):
6      return a[0] * b[0] + a[1] * b[1]
7  def cross(a, b, o = (0, 0)):
8      return (a[0] - o[0]) * (b[1] - o[1]) - (a[1] - o[1]) * (b[0] - o[0])
9  def len2(a):
10     return a[0] ** 2 + a[1] ** 2
11 def dist2(a, b):
12     return len2(vecsub(a, b))
13 def sign(x):
14     return (x > 0) - (x < 0)
15 def zero(x):
```

```
16      return abs(x) < 1E-9
```

Geometry Template (C++)

```cpp
1  template <typename T> struct point {
2      T x, y;
3      point() { x=y=0; }
4      point(T xx, T yy) : x(xx), y(yy) { }
5      template <typename U> point(point<U> o) : x(o.x), y(o.y) { }
6      point operator+(point o) const { return { x+o.x, y+o.y }; }
7      point operator-(point o) const { return { x-o.x, y-o.y }; }
8      point operator*(T o) const { return { x*o, y*o }; }
9      point operator/(T o) const { return { x/o, y/o }; }
10     bool operator==(point o) const { return x==o.x && y==o.y; };
11     bool operator<(point o) const { return tie(x, y) < tie(o.x, o.y); };
12     T dot(point o) const { return x*o.x + y*o.y; }
13     T cross(point b) const { return x*b.y - y*b.x; }
14     T cross(point b, point o) const { return (*this-o).cross(b-o); }
15     T len2() const { return x*x + y*y; }
16 };
17 using ipoint = point<ll>;
18 using dpoint = point<double>;
19 ll sign(auto x) { return (x>0) - (x<0); }
20 bool zero(double x) { return abs(x) < 1E-9; }
```

Check if point is on a line segment

```python
1  def onSegment(s, e, p):
2      # return zero(distPS(s, e, p))   if floating-point is OK
3      return cross(s, e, p) == 0 and dot(vecsub(s, p), vecsub(e, p)) <= 0
```

```cpp
1  bool onSegment(ipoint s, ipoint e, ipoint p) { return s.cross(e, p) == 0 && (s - p).dot(e - p) <= 0; }
```

Distance between point and line segment

Returns the distance from the point p to the line segment starting at s and ending at e.

```cpp
1  double distPS(ipoint s, ipoint e, ipoint p) {
2      if (s == e)
3          return sqrt((p - s).len2());
4      auto se = e - s;
5      auto sp = p - s;
6      ll d = se.len2();
7      ll t = min(d, max(0LL, (p - s).dot(e - s)));
8      return sqrt((sp * d - se * t).len2()) / d;
9  }
```

```python
1  def distPS(s, e, p):
2      if s == e:
3          return sqrt(dist2(p, s))
4      se, sp = vecsub(e, s), vecsub(p, s)
5      d = len2(se)
6      t = min(d, max(0, dot(vecsub(p,s), vecsub(e,s))))
7      return sqrt(dist2(
8          (sp[0]*d, sp[1]*d),
9          (se[0]*t, se[1]*t)
10         )) / d
```

Distance between point and line

Returns the signed distance from the point p to the line passing through the points a and b.

```
1 double distPL(ipoint a, ipoint b, ipoint p) {
2     return b.cross(p, a) / sqrt((a - b).len2());
3 }
```

```
1 def distPL(a, b, p):
2     return cross(b, p, a) / sqrt(dist2(a, b))
```

Project point to line (or reflect)

Projects the point p onto the line passing through a and b. Set refl=True to get reflection of point p across the line instead.

```
1 dpoint projPL(ipoint a, ipoint b, ipoint p, bool
      ↪ refl = false) {
2     auto v = b - a;
3     double s = (1 + refl) * b.cross(p, a) / v.len2();
4     return { p.x + v.y * s, p.y - v.x * s };
5 }
```

```
1 def projPL(a, b, p, refl = False):
2     v = vecsub(b, a)
3     s = (1 + refl) * cross(b, p, a) / len2(v)
4     return (p[0] + v[1] * s, p[1] - v[0] * s)
```

Intersection between two lines

If a unique intersection point of the lines going through s1,e1 and s2,e2 exists (1,point) is returned.
If no intersection point exists (0,(0,0)) is returned and if infinitely many exist (-1,(0,0)) is returned.

```
1 pair<int, dpoint> intersectLL(ipoint s1, ipoint e1,
      ↪ ipoint s2, ipoint e2) {
2     auto d = (e1 - s1).cross(e2 - s2);
3     if (zero(d)) # parallel
4         return { -int(zero(e1.cross(s2, s1))), {} };
5     auto p = e1.cross(e2, s2);
6     auto q = e2.cross(s1, s2);
7     return { 1, dpoint(
8         (s1.x * p + e1.x * q),
9         (s1.y * p + e1.y * q)
10    ) / d };
11 }
```

```
1 def intersectLL(s1, e1, s2, e2):
2     d = cross(vecsub(e1, s1), vecsub(e2, s2))
3     if zero(d): # parallel
4         return (-zero(cross(e1, s2, s1)), (0, 0))
5     p, q = cross(e1, e2, s2), cross(e2, s1, s2)
6     return (1,(
7         (s1[0] * p + e1[0] * q) / d,
8         (s1[1] * p + e1[1] * q) / d
9     ))
```

Intersection between two line segments

If a unique intersection is found, returns a list with only this point. If the segments intersect in many points, returns a list of 2 elements containing the start and end of the common line segment. If no intersection, returns an empty list

```
1 vector<dpoint> intersectSS(ipoint s1, ipoint e1,
      ↪ ipoint s2, ipoint e2) {
2     auto oa = e2.cross(s1, s2);
3     auto ob = e2.cross(e1, s2);
4     auto oc = e1.cross(s2, s1);
5     auto od = e1.cross(e2, s1);
6     if (sign(oa)*sign(ob)<0 && sign(oc)*sign(od)<0) {
7         return { dpoint(s1.x * ob - e1.x * oa,
8                         s1.y * ob - e1.y * oa)
9                     / double(ob - oa) };
10    }
11    set<ipoint> s;
12    if (onSegment(s2, e2, s1)) s.insert(s1);
13    if (onSegment(s2, e2, e1)) s.insert(e1);
14    if (onSegment(s1, e1, s2)) s.insert(s2);
15    if (onSegment(s1, e1, e2)) s.insert(e2);
16    return {all(s)};
17 }
```

```
1 def intersectSS(s1, e1, s2, e2):
2     oa = cross(e2, s1, s2)
3     ob = cross(e2, e1, s2)
4     oc = cross(e1, s2, s1)
5     od = cross(e1, e2, s1)
6     if sign(oa)*sign(ob)<0 and sign(oc)*sign(od)<0:
7         div = ob - oa
8         return [(
9             (s1[0] * ob - e1[0] * oa) / div,
10            (s1[1] * ob - e1[1] * oa) / div
11        )]
12    s = set()
13    if onSegment(s2, e2, s1): s.add(s1)
14    if onSegment(s2, e2, e1): s.add(e1)
15    if onSegment(s1, e1, s2): s.add(s2)
16    if onSegment(s1, e1, e2): s.add(e2)
17    return list(s)
```

Polygon area

Returns twice the signed area of a polygon. Clockwise enumeration gives negative area.

```
1 ll polygonArea2(const vector<ipoint>& v) {
2     ll a = 0;
3     for (ll i = 0; i < (ll)v.size(); i++)
4         a += v[i].cross(v[(i+1) % v.size()]);
5     return a;
6 }
```

```
1 def polygonArea2(v):
2     return sum(map(lambda i: cross(v[i - 1], v[i]),
      ↪ range(len(v))))
```

Area of union of polygons

Calculates the area of the union of multiple polygons (not necessarily convex). The points within each polygon must be given in CCW order. Time complexity: $\mathcal{O}(n^2)$, where N is the total number of points.

```
1  double rat(dpoint a, dpoint b) { return sign(b.x) ? a.x/b.x : a.y/b.y; }
2  double polyUnion(vector<vector<dpoint>>& poly) {
3      double ret = 0;
4      for (size_t i = 0; i < poly.size(); i++)
5          for (size_t v = 0; v < poly[i].size(); v++) {
6              dpoint A = poly[i][v], B = poly[i][(v + 1) % poly[i].size()];
7              vector<pair<double, int>> segs = {{0, 0}, {1, 0}};
8              for (size_t j = 0; j < poly.size(); j++) if (i != j) {
9                  for (size_t u = 0; u < poly[j].size(); u++) {
10                     dpoint C = poly[j][u], D = poly[j][(u + 1) % poly[j].size()];
11                     int sc = sign(B.cross(C, A)), sd = sign(B.cross(D, A));
12                     if (sc != sd) {
13                         double sa = C.cross(D, A), sb = C.cross(D, B);
14                         if (min(sc, sd) < 0)
15                             segs.emplace_back(sa / (sa - sb), sign(sc - sd));
16                     } else if (!sc && !sd && j<i && sign((B-A).dot(D-C))>0){
17                         segs.emplace_back(rat(C - A, B - A), 1);
18                         segs.emplace_back(rat(D - A, B - A), -1);
19                     }
20                 }
21             }
22             sort(all(segs));
23             for (auto& s : segs) s.first = min(max(s.first, 0.0), 1.0);
24             double sum = 0;
25             int cnt = segs[0].second;
26             for (ll j = 1; j < (ll)segs.size(); j++) {
27                 if (!cnt) sum += segs[j].first - segs[j - 1].first;
28                 cnt += segs[j].second;
29             }
30             ret += A.cross(B) * sum;
31         }
32     return ret / 2;
33 }
```

Angle struct

Struct for representing angles using integer points and sorting them.

```
1  struct Angle {
2      ll x, y, t;
3      Angle(ll X, ll Y, ll T=0) : x(X), y(Y), t(T) {}
4      Angle operator-(Angle b) const { return {x-b.x, y-b.y, t}; }
5      ll half() const {
6          assert(x || y);
7          return y < 0 || (y == 0 && x < 0);
8      }
9      Angle t90() const { return {-y, x, t + (half() && x >= 0)}; }
10     Angle t180() const { return {-x, -y, t + half()}; }
11     Angle t360() const { return {x, y, t + 1}; }
12 };
13 bool operator<(Angle a, Angle b) {
14     // add a.dist2() and b.dist2() to the tuples to also compare distances
15     return make_tuple(a.t, a.half(), a.y * (ll)b.x) < make_tuple(b.t, b.half(), a.x * (ll)b.y);
16 }
17 // Given two points (a.x, a.y) and (b.x, b.y), calculates the smallest angle between them.
18 pair<Angle, Angle> segmentAngles(Angle a, Angle b) {
19     if (b < a) swap(a, b);
20     return (b < a.t180() ? make_pair(a, b) : make_pair(b, a.t360()));
21 }
22 Angle operator+(Angle a, Angle b) {
23     Angle r(a.x + b.x, a.y + b.y, a.t);
24     if (a.t180() < r) r.t--;
25     return r.t180() < a ? r.t360() : r;
26 }
27 Angle angleDiff(Angle a, Angle b) {
28     ll tu = b.t - a.t; a.t = b.t;
29     return {a.x*b.x + a.y*b.y, a.x*b.y - a.y*b.x, tu - (b < a)};
30 }
```

Point inside polygon

Returns true if the point `pt` lies within the polygon `poly`. If strict is true, returns false for points on the boundary.

```python
def pointInPolygon(poly, pt, strict = True):
    c = False
    for i in range(len(poly)):
        q = poly[i - 1]
        if onSegment(q, poly[i], pt):
            return not strict
        c ^= ((pt[1] < q[1]) - (pt[1] < poly[i][1])) * cross(q, poly[i], pt) > 0
    return c
```

```cpp
bool pointInPolygon(const vector<ipoint>& poly, ipoint p, bool strict = true) {
    bool c = false;
    auto prev = poly.back();
    for (auto cur : poly) {
        if (onSegment(prev, cur, p)) return !strict;
        c ^= ((p.y < prev.y) - (p.y < cur.y)) * prev.cross(cur, p) > 0;
        prev = cur;
    }
    return c;
}
```

Intersection between two circles

Computes the pair of points at which two circles intersect. Returns `None` in case of no intersection.

```cpp
template <typename T> optional<array<dpoint, 2>>
intersectCC(point<T> c1, point<T> c2, T r1, T r2) {
    if (c1 == c2) {
        assert(r1 != r2);
        return { };
    }
    auto vec = c2 - c1;
    T d2 = vec.len2(), sm = r1 + r2, dif = r1 - r2;
    if (sm * sm < d2 || dif * dif > d2)
        return { };
    double p = double(d2 + r1*r1 - r2*r2) / (d2 * 2);
    dpoint mid(c1.x + vec.x * p, c1.y + vec.y * p);
    dpoint per = dpoint(-vec.y, vec.x) *
        sqrt(max(0.0, r1 * r1 - p * p * d2) / d2);
    return { { mid+per, mid-per } };
}
```

```python
def intersectCC(c1, c2, r1, r2):
    if c1 == c2:
        assert(r1 != r2)
        return None
    vec = vecsub(c2, c1)
    d2 = len2(vec)
    if (r1 + r2) ** 2 < d2 or (r1 - r2) ** 2 > d2:
        return None
    p = (d2 + r1 ** 2 - r2 ** 2) / (d2 * 2)
    h2 = r1 ** 2 - p * p * d2
    mid = (c1[0] + vec[0] * p, c1[1] + vec[1] * p)
    plen = sqrt(max(0, h2) / d2)
    per = (-vec[1] * plen, vec[0] * plen)
    return (vecadd(mid, per), vecsub(mid, per))
```

Intersection between circle and line

Computes the intersection between a circle and a line. Returns a list of either 0, 1, or 2 intersection points.

```cpp
vector<dpoint> intersectCL(dpoint c, double r,
        dpoint a, dpoint b) {
    dpoint ab = b - a;
    dpoint p = a + ab * (c-a).dot(ab) / ab.len2();
    double s = a.cross(b, c);
    double h2 = r*r - s*s / ab.len2();
    if (h2 < 0) return {};
    if (h2 == 0) return {p};
    dpoint h = ab * sqrt(h2 / ab.len2());
    return {p - h, p + h};
}
```

```python
def intersectCL(c, r, a, b):
    ab = vecsub(b, a)
    ps = dot(vecsub(c, a), ab) / len2(ab)
    p = (a[0] + ab[0] * ps, a[1] + ab[1] * ps)
    h2 = r ** 2 - cross(a, b, c) ** 2 / len2(ab)
    if h2 < 0: return []
    if h2 == 0: return [p]
    h2 = sqrt(h2 / ab.len2())
    h = (ab[0] * h2, ab[1] * h2);
    return [vecsub(p, h), vecadd(p, h)]
```

Circumcircle

Returns a circle from three points.

```cpp
pair<dpoint, double> circumcirle(array<dpoint,3> p) {
    auto b = p[2] - p[0], c = p[1] - p[0];
    double bc = b.cross(c);
    assert(!zero(bc)); // collinear
    auto x = b * c.len2() - c * b.len2();
    dpoint rc = dpoint(-x.y, x.x) / bc;
    return { p[0] + rc, sqrt(rc.len2()) };
}
```

```python
def circumcirle(p1, p2, p3):
    b, c = vecsub(p3, p1), vecsub(p2, p1)
    bc, c2, b2 = cross(b, c) * 2, len2(c), len2(b)
    assert not zero(bc) # collinear
    rc = ((c[1]*b2 - b[1]*c2)/bc,
          (b[0]*c2 - c[0]*b2)/bc)
    return (vecadd(p1,rc), sqrt(len2(rc)))
```

Circle-polygon area

Returns the area of the intersection of a circle with a counter-clockwise polygon. Time complexity: $\mathcal{O}(n)$

```cpp
double circlePolyArea(dpoint c, double r, vector<dpoint> ps) {
    auto arg = [&](dpoint p, dpoint q) { return atan2(p.cross(q), p.dot(q)); };
    auto tri = [&](dpoint p, dpoint q) {
        double r2 = r * r / 2;
        dpoint d = q - p;
        double a = d.dot(p)/d.len2(), b = (p.len2()-r*r)/d.len2();
        double det = a * a - b;
        if (det <= 0) return arg(p, q) * r2;
        auto s = max(0., -a-sqrt(det)), t = min(1., -a+sqrt(det));
        if (t < 0 || 1 <= s) return arg(p, q) * r2;
        dpoint u = p + d * s, v = p + d * t;
        return arg(p,u) * r2 + u.cross(v)/2 + arg(v,q) * r2;
    };
    double sum = 0.0;
    for (size_t i = 0; i < ps.size(); i++)
        sum += tri(ps[i] - c, ps[(i + 1) % ps.size()] - c);
    return sum;
}
```

Circle tangents

Finds the external tangents of two circles, or internal if r2 is negated.
Can return 0, 1, or 2 tangents – 0 if one circle contains the other (or overlaps it, in the internal case, or if the circles are the same);
1 if the circles are tangent to each other (in which case .first = .second and the tangent line is perpendicular to the line between
the centers). .first and .second give the tangency points at circle 1 and 2 respectively. To find the tangents of a circle with a point
set r2 to 0.

```cpp
vector<pair<dpoint, dpoint>> circleTangents(dpoint
 ↪ c1, double r1, dpoint c2, double r2) {
    dpoint d = c2 - c1, dp = {-d.y, d.x};
    double dr = r1 - r2, d2 = d.len2();
    double h2 = d2 - dr * dr;
    if (d2 == 0 || h2 < 0)  return {};
    vector<pair<dpoint, dpoint>> out;
    for (double s : {-1, 1}) {
        dpoint v = (d * dr + dp * sqrt(h2) * s) / d2;
        out.push_back({c1 + v * r1, c2 + v * r2});
    }
    if (h2 == 0) out.pop_back();
    return out;
}
```

```python
def circleTangents(c1, r1, c2, r2):
    d = vecsub(c2, c1)
    dr, d2 = r1 - r2, len2(d)
    h2, s1, s2 = d2 - dr**2, r1 / d2, r2 / d2
    if d2 == 0 or h2 < 0: return []
    out = []
    for s in [-1, 1]:
        vx = d[0] * dr - d[1] * sqrt(h2) * s
        vy = d[1] * dr + d[0] * sqrt(h2) * s
        out.append((vecadd(c1, (vx*s1, vy*s1)),
                    vecadd(c2, (vx*s2, vy*s2))))
    if h2 == 0: out.pop()
    return out
```

Convex hull

Returns a list of points on the convex hull in counter-clockwise order. Points on the edge of the hull between two other points are
not considered part of the hull. Time complexity: $\mathcal{O}(n \log n)$

```cpp
auto convexHull(vector<ipoint> pts) {
    if (pts.size() <= 1) return pts;
    sort(all(pts));
    decltype(pts) h;
    auto f = [&] (ll s) {
        for (auto p : pts) {
            while ((ll)h.size() >= s + 2 &&
 ↪ h.back().cross(p, h[h.size() - 2]) <= 0)
                h.pop_back();
            h.push_back(p);
        }
        h.pop_back();
    };
    f(0);
    reverse(all(pts));
    f(h.size());
    if (h.size() == 2 && h[0] == h[1]) h.pop_back();
    return h;
}
```

```python
def convexHull(pts):
    if len(pts) <= 1:
        return pts
    pts.sort()
    t, s, h = 0, 0, [0] * (len(pts) + 1)
    for i in range(2):
        for p in pts:
            while t >= s + 2 and cross(h[t - 1], p,
 ↪ h[t - 2]) <= 0:
                t -= 1
            h[t], t = p, t + 1
        s = t = t - 1
        pts.reverse()
    return h[:t - (t == 2 and h[0] == h[1])]
```

Data Structures

Segment Tree

```cpp
struct SegTree {
    using T = ll;
    T f(T a, T b) { return a + b; }
    static constexpr T UNIT = 0;//neutral value for f

    vector<T> s; ll n;
    SegTree(ll len) : s(2 * len, UNIT), n(len) {}
    void set(ll pos, T val) {
        for (s[pos += n] = val; pos /= 2;)
            s[pos] = f(s[pos * 2], s[pos * 2 + 1]);
    }
    T query(ll lo, ll hi) { // hi not included
        T ra = UNIT, rb = UNIT;
        for (lo+=n, hi+=n; lo < hi; lo/=2, hi/=2) {
            if (lo % 2) ra = f(ra, s[lo++]);
            if (hi % 2) rb = f(s[--hi], rb);
        }
        return f(ra, rb);
    }
};
```

```python
class SegTree:
    def f(a, b):
        return a + b
    UNIT = 0 # neutral value for f

    def __init__(self, n):
        self.s = [self.UNIT] * (2 * n)
        self.n = n
    def set(self, pos, val):
        pos += self.n
        self.s[pos] = val
        while pos > 1:
            pos //= 2
            self.s[pos] = SegTree.f(self.s[pos * 2],
↪ self.s[pos * 2 + 1])
    def query(self, lo, hi): # hi not included
        ra, rb = self.UNIT, self.UNIT
        lo, hi = lo + self.n, hi + self.n
        while lo < hi:
            if lo % 2:
                ra = SegTree.f(ra, self.s[lo])
                lo += 1
            if hi % 2:
                hi -= 1
                rb = SegTree.f(self.s[hi], rb)
            lo, hi = lo // 2, hi // 2
        return SegTree.f(ra, rb)
```

Fenwick Tree

```cpp
struct FenwickTree {
    FenwickTree(ll n) : v(n + 1, 0) { }
    ll lsb(ll x) { return x & (-x); }
    ll prefixSum(ll n) { //sum of the first n items (nth not included)
        ll sum = 0;
        for (; n; n -= lsb(n))
            sum += v[n];
        return sum;
    }
    void adjust(ll i, ll delta) {
        for (i++; i < v.size(); i += lsb(i))
            v[i] += delta;
    }
    vector<ll> v;
};
```

Sparse Table

```cpp
struct SparseTable {
    using T = ll;
    T f(T a, T b) { return min(a, b); }
    ll node(ll l, ll i) { return i + l * n; }
    ll n; vector<T> v;
    SparseTable(vector<T> values) : n(values.size()), v(move(values)) {
        ll d = log2(n);
        v.resize((d + 1) * n);
        for (ll L = 0, s = 1; L < d; L++, s *= 2) {
            for (ll i = 0; i < n; i++) {
                v[node(L + 1, i)] = f(v[node(L, i)], v[node(L, min(i + s, n - 1))]);
            }
        }
    }
    T query(ll lo, ll hi) { assert(hi > lo);
        ll l = (ll)log2(hi - lo);
        return f(v[node(l, lo)], v[node(l, hi - (1 << l))]);
    }
};
```

Lazy Segment Tree

Segment tree with support for range updates. Use T = pair of value and index to get index from queries.
All ranges are `(lo, hi]` (hi is not included). `fQuery` defines the function to be used for queries (currently min) and `fUpdate` defines
the function to be used for updates (currently addition).

```
1  struct LazyST {
2      using T = ll;
3      T f(T a, T b) { return min(a, b); }
4      static const T QUERY_UNIT = LLONG_MAX; // neutral value for f
5
6      struct Node {
7          T val = QUERY_UNIT; // current value of this segment
8          optional<T> p; // value being pushed down into this segment
9      };
10     int len; vector<Node> nodes;
11     LazyST(int l) : len(pow(2, ceil(log2(l)))), nodes(len * 2) { }
12     void update(int lo, int hi, T val) { u(lo, hi, val, 1, 0, len); }
13     T query(int lo, int hi) { return q(lo, hi, 1, 0, len); }
14 private:
15     #define LST_NEXT int l = n * 2; int r = l + 1; int mid = (nlo + nhi) / 2
16     void push(int n, int nlo, int nhi) {
17         if (!nodes[n].p) return;
18         LST_NEXT;
19         u(nlo, nhi, *nodes[n].p, l, nlo, mid);
20         u(nlo, nhi, *nodes[n].p, r, mid, nhi);
21         nodes[n].p = {};
22     }
23     void u(int qlo, int qhi, T val, int n, int nlo, int nhi) {
24         if (nhi <= qlo || nlo >= qhi) return;
25         if (nlo >= qlo && nhi <= qhi) {

53 }
```

Line Container

Container where you can add lines of the form $kx + m$, and query maximum values at points x. All operations are $\mathcal{O}(\log(n))$. For doubles, use `inf = 1/.0` and `div(a,b) = a/b`

```
1 struct Line {
2     mutable ll k, m, p;
3     bool operator<(const Line& o) const { return k < o.k; }
4     bool operator<(ll x) const { return p < x; }
5 };
6 struct LineContainer : multiset<Line, less<>> {
7     const ll inf = LLONG_MAX;
8     ll div(ll a, ll b) { // floored division
9         return a / b - ((a ^ b) < 0 && a % b);
10     }
11     bool isect(iterator x, iterator y) {
12         if (y == end()) { x->p = inf; return false; }
13         if (x->k == y->k) x->p = x->m > y->m ? inf : -inf;
14         else x->p = div(y->m - x->m, x->k - y->k);
15         return x->p >= y->p;
16     }
17     void add(ll k, ll m) {
18         auto z = insert({k, m, 0}), y = z++, x = y;
19         while (isect(y, z)) z = erase(z);
20         if (x != begin() && isect(--x, y)) isect(x, y = erase(y));
21         while ((y = x) != begin() && (--x)->p >= y->p) isect(x, erase(y));
22     }
23     ll query(ll x) { assert(!empty());
24         auto l = *lower_bound(x);
25         return l.k * x + l.m;
26     }
27 };
```

Heavy-Light Decomposition

Constructs a heavy-light decomposition of a tree and generates indices for nodes that are consecutive within each heavy path.

For node i, hchild[i] is the heavy child (or -1 for leaf nodes), hpLeaf[i] and hpRoot[i] are the leaf and root nodes of the heavy path passing through the node, and arridx[i] is the generated heavy path consecutive index (in the range $(0, n]$). Within one heavy path, the deepest node has the lowest arridx[i];

lca(a, b) returns the lca of a and b. If intv is not null, *intv will receive up to $2 \log_2(n)$ non-overlapping intervals such that there exists an interval i $\in$ *intv where i.first <= arridx[x] < i.second iff. the node x is on the path between a and b. If intvIncludeLCA is false, the lca of a and b will not be included in these intervals.

```
1  struct HLD {
2      vector<ll> depth, parent, arridx, hpLeaf, hpRoot, hchild;
3      HLD(const vector<vector<ll>>& t) { // t is an adjacency list, or a child list for a tree rooted in node 0
4          parent = hchild = vector<ll>(t.size(), -1);
5          depth = arridx = hpLeaf = hpRoot = vector<ll>(t.size());
6          vector<ll> sts(t.size(), 1), ci(t.size()), st{0}, trav{0};
7          while (!st.empty()) {

52         }
53         if (depth[a] > depth[b])
54             swap(a, b);
55         addi(arridx[b], arridx[a] + intvIncludeLCA);
56         return a;
57     }
58 };
```

Link Cut Tree

Represents a forest of unrooted trees. You can add and remove edges (as long as the result is still a forest), and check whether two nodes are in the same tree. All operations are amortized $\mathcal{O}(\log(n))$.

```cpp
struct Node { // Splay tree. Root's pp contains
    ↪ tree's parent.
    Node *p = 0, *pp = 0, *c[2];
    bool flip = 0;
    Node() { c[0] = c[1] = 0; fix(); }
    void fix() {

```

Graph Algorithms

Maximum Flow (Dinic's Algorithm)

Constructor takes number of nodes, call `addEdge` to add edges and `calc` to find maximum flow. To obtain the actual flow, look at positive values of `Edge::cap` only.

Time complexity: $\mathcal{O}(VE\log U)$ where $U = \max |\mathsf{cap}|$. $\mathcal{O}(\min(E^{1/2}, V^{2/3})E)$ if $U = 1$. $\mathcal{O}(\sqrt{V}E)$ for bipartite matching.

```cpp
struct Dinic {
    struct Edge {
        int to, rev;
        ll c, oc;
        ll flow() { return max(oc - c, 0LL); }
    };
    vector<int> lvl, ptr, q;
    vector<vector<Edge>> adj;
    Dinic(int n) : lvl(n), ptr(n), q(n), adj(n) {}
```

```
10      void addEdge(int a, int b, ll c, ll rcap = 0) {
11          adj[a].push_back({b, (int)adj[b].size(), c, c});
12          adj[b].push_back({a, (int)adj[a].size() - 1, rcap, rcap});
13      }
14      ll dfs(int v, int t, ll f) {
15          if (v == t || !f) return f;
16          for (int& i = ptr[v]; i < adj[v].size(); i++) {
17              Edge& e = adj[v][i];
18              if (lvl[e.to] == lvl[v] + 1)
19                  if (ll p = dfs(e.to, t, min(f, e.c))) {
20                      e.c -= p, adj[e.to][e.rev].c += p;
21                      return p;
22                  }
23          }
24          return 0;
25      }
26      ll calc(int s, int t) {
27          ll flow = 0; q[0] = s;
28          for (int L = 0; L < 31; L++) do { // 'int L=30' maybe faster for random data
29              lvl = ptr = vector<int>(q.size());
30              int qi = 0, qe = lvl[s] = 1;
31              while (qi < qe && !lvl[t]) {
32                  int v = q[qi++];
33                  for (Edge e : adj[v])
34                      if (!lvl[e.to] && e.c >> (30 - L))
35                          q[qe++] = e.to, lvl[e.to] = lvl[v] + 1;
36              }
37              while (ll p = dfs(s, t, LLONG_MAX)) flow += p;
38          } while (lvl[t]);
39          return flow;
40      }
41      bool leftOfMinCut(int a) { return lvl[a] != 0; }
42 };
```

Bellman Ford

Calculates shortest paths from s in a graph that might have negative edge weights. Unreachable nodes get `dist = inf`; nodes reachable through negative-weight cycles get `dist = -inf`. Assumes $V^2 \max |w_i| < 2^{63}$. Time complexity: $\mathcal{O}(VE)$

```
1  const ll inf = 1LL << 62;
2  struct Ed {
3      int a, b, w;
4      int s() { return a < b ? a : -a; }
5  };
6  struct Node { ll dist = inf; int prev = -1; };
7  void bellmanFord(vector<Node>& nodes, vector<Ed>& eds, int s) {
8      nodes[s].dist = 0;
9      sort(all(eds), [] (Ed a, Ed b) { return a.s() < b.s(); });
10     int lim = nodes.size() / 2 + 2;
11     for(int i = 0; i < lim; i++)
12         for(auto& ed : eds) {
13             Node cur = nodes[ed.a], &dest = nodes[ed.b];
14             if (abs(cur.dist) == inf) continue;
15             ll d = cur.dist + ed.w;
16             if (d < dest.dist) {
17                 dest.prev = ed.a;
18                 dest.dist = (i < lim - 1 ? d : -inf);
19             }
20         }
21     for(int i = 0; i < lim; i++)
22         for(auto& e : eds)
23             if (nodes[e.a].dist == -inf)
24                 nodes[e.b].dist = -inf;
25 }
```

Floyd Warshall

Calculates all-pairs shortest path in a directed graph. As output, `m[i][j]` is set to the shortest distance between i and j, `inf` if no path, or `-inf` if the path goes through a negative-weight cycle. Time complexity: $\mathcal{O}(N^3)$.

```
1  from math import inf
2  def floydWarshall(m): # m[i][j] should be inf if i and j are not adjacent
3      for i in range(len(m)):
```

```python
4        m[i][i] = min(m[i][i], 0)
5    for k in range(len(m)):
6        for i in range(len(m)):
7            for j in range(len(m)):
8                if m[i][k] != inf and m[k][j] != inf:
9                    m[i][j] = min(m[i][j], max(m[i][k] + m[k][j], -inf))
10   #only needed if weights can be negative:
11   for k in range(len(m)):
12       if m[k][k] < 0:
13           for i in range(len(m)):
14               for j in range(len(m)):
15                   if m[i][k] != inf and m[k][j] != inf:
16                       m[i][j] = -inf
```

```cpp
1  const ll inf = 1LL << 62;
2  void floydWarshall(vector<vector<ll>>& m) { // m[i][j] should be inf if i and j are not adjacent
3      int n = m.size();
4      for(int i = 0; i < n; i++)
5          m[i][i] = min(m[i][i], 0LL);
6      for(int k = 0; k < n; k++)
7          for(int i = 0; i < n; i++)
8              for(int j = 0; j < n; j++)
9                  if (m[i][k] != inf && m[k][j] != inf)
10                     m[i][j] = min(m[i][j], max(m[i][k] + m[k][j], -inf));
11     //only needed if weights can be negative:
12     for(int k = 0; k < n; k++)
13         if (m[k][k] < 0)
14             for(int i = 0; i < n; i++)
15                 for(int j = 0; j < n; j++)
16                     if (m[i][k] != inf && m[k][j] != inf)
17                         m[i][j] = -inf;
18 }
```

Biconnected Components

Finds all biconnected components in an undirected graph, and returns a list of edges in each. Time complexity: $\mathcal{O}(E + V)$. Note that a node can be in several components, and bridges are by default returned as a single-edge biconnected component.

```cpp
1  struct BCC {
2      const vector<vector<ll>>* adj;
3      vector<ll> dfsNum;
4      ll nnum = 0;
5      vector<pair<ll, ll>> st;
6      vector<vector<pair<ll, ll>>> bccs;
7      ll dfs(ll cur, ll par) {
8          ll top = dfsNum[cur] = ++nnum;
9          for (ll nxt : (*adj)[cur]) {
10             if (nxt == par) continue;
11             if (dfsNum[nxt]) {
12                 top = min(top, dfsNum[nxt]);
13                 if (dfsNum[nxt] < dfsNum[cur])
14                     st.emplace_back(cur, nxt);
15                 continue;
16             }
17             ll si = st.size();
18             ll up = dfs(nxt, cur);
19             top = min(top, up);
20             if (up == dfsNum[cur]) {
21                 bccs.emplace_back(st.begin() + si, st.end());
22                 bccs.back().emplace_back(cur, nxt);
23                 st.resize(si);
24             } else if (up < dfsNum[cur]) {
25                 st.emplace_back(cur, nxt);
26             } else { //the edge (cur,nxt) is a bridge
27                 bccs.push_back({make_pair(cur, nxt)}); //remove if bridges should not form BCCs
28             }
29         }
30         return top;
31     }
32 };
33 vector<vector<pair<ll, ll>>> findBCC(const vector<vector<ll>>& adj) {
34     BCC bcc = { &adj, vector<ll>(adj.size()) };
35     for (ll i = 0; i < (ll)adj.size(); i++)
```

```
36          if (bcc.dfsNum[i] == 0)
37              bcc.dfs(i, -1);
38      return move(bcc.bccs);
39 }
```

Strongly Connected Components

Finds strongly connected components in a directed graph. Usage: `scc(graph, [&](vector<int>& v) { ... })}` visits all components in reverse topological order. `comp[i]` holds the component index of a node (a component only has edges to components with lower index). `ncomps` will contain the number of components. Time complexity: $\mathcal{O}(E + V)$

```
1  vector<int> val, comp, z, cont; int Time, ncomps;
2  template<class G, class F> int dfs(int j, G& g, F& f) {
3      int low = val[j] = ++Time, x; z.push_back(j);
4      for(auto& e : g[j]) if (comp[e] < 0)
5          low = min(low, val[e] ?: dfs(e,g,f));
6      if (low == val[j]) {
7          do {
8              x = z.back(); z.pop_back();
9              comp[x] = ncomps;
10             cont.push_back(x);
11         } while (x != j);
12         f(cont); cont.clear();
13         ncomps++;
14     }
15     return val[j] = low;
16 }
17 template<class G, class F> void scc(G& g, F f) {
18     val.assign(g.size(), 0);
19     comp.assign(g.size(), -1);
20     Time = ncomps = 0;
21     for(size_t i = 0; i < g.size(); i++)
22         if (comp[i] < 0) dfs(i, g, f);
23 }
```

2-SAT

Calculates a valid assignment to boolean variables in a 2-SAT problem. Negated variables are represented by bit-inversions (~x). Time complexity: $\mathcal{O}(N + E)$, where N is the number of boolean variables, and E is the number of clauses.

```
1  struct TwoSat {
2  int N;
3  vector<vector<int>> gr;
4  vector<int> values; // 0 = false, 1 = true
5  TwoSat(int n = 0) : N(n), gr(2 * n) {}
6  void either(int f, int j) {
7      f = max(2 * f, -1-2*f);
8      j = max(2 * j, -1-2*j);
9      gr[f].push_back(j ^ 1);
10     gr[j].push_back(f ^ 1);
11 }
12 void set_value(int x) { either(x, x); }
13 vector<int> val, comp, z; int time = 0;
14 int dfs(int i) {
15     int low = val[i] = ++time, x;
16     z.push_back(i);
17     for(auto& e : gr[i])
18         if (!comp[e])
19             low = min(low, val[e] ?: dfs(e));
20     if (low == val[i]) do {
21         x = z.back(); z.pop_back();
22         comp[x] = low;
23         if (values[x>>1] == -1)
24             values[x>>1] = x&1;
25     } while (x != i);
26     return val[i] = low;
27 }
28 bool solve() {
29     values.assign(N, -1);
30     val.assign(2 * N, 0); comp = val;
31     for (int i = 0; i < 2 * N; ++i)
32         if (!comp[i])
33             dfs(i);
34     for (int i = 0; i < N; ++i)
35         if (comp[2 * i] == comp[2 * i + 1])
36             return 0;
37     return 1;
38 }
39 int add_var() { //optional
40     gr.emplace_back();
41     gr.emplace_back();
42     return N++;
43 }
44 void at_most_one(const vector<int>& li) { //optional
45     if (li.size() <= 1) return;
46     int cur = ~li[0];
47     for(size_t i = 2; i < li.size(); i++) {
48         int next = add_var();
49         either(cur, ~li[i]);
50         either(cur, next);
51         either(~li[i], next);
52         cur = ~next;
53     }
54     either(cur, ~li[1]);
55 }
56 };
```

Usage:

```
1 TwoSat ts(number of boolean variables);
2 ts.either(0, ~3); // Var 0 is true or var 3 is false
3 ts.set_value(2); // Var 2 is true
4 ts.at_most_one({0,~1,2}); // <= 1 of vars 0, ~1 and
       ↪ 2 are true
5 ts.solve(); // Returns true iff it is solvable.
       ↪ ts.values holds the variables' values
```

Minimum Cost Maximum Flow

Calculates min-cost max-flow. `cap[i][j]!=cap[j][i]` is allowed; double edges are not. To obtain the actual flow, look at positive values only. Time complexity: $\mathcal{O}(E^2)$. If costs can be negative, call `setpi` before `maxflow`. Negative cost cycles are not supported.

```cpp
#include <bits/extc++.h>
const ll INF = LLONG_MAX / 4;
struct MCMF {
    int N;
    vector<vector<int>> ed, red;
    vector<vector<ll>> cap, flow, cost;
    vector<int> seen;
    vector<ll> dist, pi;
    vector<pair<int, int> > par;
    MCMF(int N) : N(N), ed(N), red(N), cap(N, vector<ll>(N)),
        flow(cap), cost(cap), seen(N), dist(N), pi(N), par(N) { }
    void addEdge(int from, int to, ll cap, ll cost) {
        this->cap[from][to] = cap;
        this->cost[from][to] = cost;
        ed[from].push_back(to);
        red[to].push_back(from);
    }
    void path(int s) {
        fill(all(seen), 0);
        fill(all(dist), INF);
        dist[s] = 0; ll di;
        __gnu_pbds::priority_queue<pair<ll, int>> q;
        vector<decltype(q)::point_iterator> its(N);
        q.push({0, s});
        auto relax = [&](int i, ll cap, ll cost, int dir) {
            ll val = di - pi[i] + cost;
            if (cap && val < dist[i]) {
                dist[i] = val;
                par[i] = {s, dir};
                if (its[i] == q.end())
                    its[i] = q.push({-dist[i], i});
                else
                    q.modify(its[i], {-dist[i], i});
            }
        };
        while (!q.empty()) {

74        }
75 };
```

Weighted Bipartite Matching

Given a weighted bipartite graph, matches every node on the left with a node on the right such that no nodes are in two matchings and the sum of the edge weights is minimal.

Takes cost[N][M], where cost[i][j] = cost for L[i] to be matched with R[j] and returns (min cost, match), where L[i] is matched with R[match[i]]. Negate costs for max cost. Requires $N \leq M$. Time complexity: $\mathcal{O}(N^2 M)$

```
1  pair<ll, vector<ll>> hungarian(const vector<vector<ll>> &a) {
2      if (a.empty()) return {0, {}};

Math

Fast Modudo Operations

```
1  using ull = unsigned long long;
2  ull modmul(ull a, ull b, ull M) {
3      ll ret = a * b - M * ull(1.L / M * a * b);
4      return ret + M * (ret < 0) - M * (ret >= (ll)M);
5  }
6  ull modpow(ull b, ull e, ull mod) {
7      ull ans = 1;
8      for (; e; b = modmul(b, b, mod), e /= 2)
9          if (e & 1) ans = modmul(ans, b, mod);
10     return ans;
11 }
```

Is Prime (Miller-Rabin)

Guaranteed to work for numbers up to $7 \cdot 10^{18}$. For larger numbers, use Python and extend A randomly.

```cpp
#include "modmul.cpp"
bool isPrime(ull n) {
    if (n < 2 || n % 6 % 4 != 1)
        return (n | 1) == 3;
    ull s = __builtin_ctzll(n-1);
    for (ull a : {2, 325, 9375, 28178, 450775,
      9780504, 1795265022}) {
        ull p = modpow(a % n, n >> s, n), i = s;
        while (p != 1 && p != n - 1 && a % n && i--)
            p = modmul(p, p, n);
        if (p != n-1 && i != s) return 0;
    }
    return 1;
}
```

```python
def ctz(x): return (x & -x).bit_length() - 1
A = [2,325,9375,28178,450775,9780504,1795265022]
def isPrime(n):
    if n < 2 or n % 6 % 4 != 1:
        return (n | 1) == 3
    s = ctz(n-1)
    for a in A:
        p, i = pow(a % n, n >> s, n), s
        while p != 1 and p != n - 1 and a % n and i:
            p, i = p * p % n, i - 1
        if p != n-1 and i != s:
            return False
    return True
```

Prime Factorization (Pollard-rho)

Returns prime factors of a number, in arbitrary order.

```cpp
#include "is_prime.cpp"
ull pollard(ull n) {
    auto f = [n](ull x) {return modmul(x, x, n)+1;};
    ull x = 0, y = 0, t = 30, prd = 2, i = 1;
    while (t++ % 40 || gcd(prd, n) == 1) {
        if (x == y) x = ++i, y = f(x);
        ull q = modmul(prd, max(x,y)-min(x,y), n);
        if (q) prd = q;
        x = f(x), y = f(f(y));
    }
    return gcd(prd, n);
}
vector<ull> factor(ull n) {
    if (n == 1) return {};
    if (isPrime(n)) return {n};
    ull x = pollard(n);
    auto l = factor(x), r = factor(n / x);
    l.insert(l.end(), all(r));
    return l;
}
```

```python
from math import gcd
def pollard(n):
    f = lambda x: x * x % n + 1
    x, y, t, prd, i = 0, 0, 30, 2, 1
    while t % 40 or gcd(prd, n) == 1:
        if x == y:
            i += 1
            x, y = i, f(i)
        if q := prd * (max(x,y) - min(x,y)) % n:
            prd = q
        x, y = f(x), f(f(y))
        t += 1
    return gcd(prd, n)
def factor(n):
    if n == 1: return []
    if isPrime(n): return [n]
    x = pollard(n)
    return factor(x) + factor(n // x)
```

Extended Euclidean Algorithm

Finds the Greatest Common Divisor to the integers a and b. Also finds two integers x and y, such that $ax+by = \gcd(a,b)$. Returns a tuple of $(\gcd(a,b), x, y)$. If a and b are coprime, then x is the inverse of $a \pmod{b}$.

```cpp
ll extEuclid(ll a, ll b, ll& x, ll& y) {
    if (b) {
        ll d = extEuclid(b, a % b, y, x);
        return y -= a / b * x, d;
    }
    return x = 1, y = 0, a;
}
```

```python
def extEuclid(a, b):
    if b:
        d, x, y = extEuclid(b, a % b)
        return (d, y, x - a // b * y)
    return (a, 1, 0)
```

Chinese Remainder Theorem

Finds the smallest number x satisfying a system of congruences, each in the form $x \equiv r_i \pmod{m_i}$. All pairs of m_i must be coprime. eq is a list of tuples describing the equations, the i:th of which should be (r_i, m_i).

```cpp
//no overflow if the product of all eq.second < 2^62
ll crt(const vector<pair<ll, ll>>& eq) {
    ll p = 1, res = 0;
    for (auto e : eq) p *= e.second;
    for (auto e : eq) {
        ll pp = p / e.second, ppi, y;
        extEuclid(pp, e.second, ppi, y);
        res = (res + e.first * ppi * pp) % p;
    }
    return res;
}
```

```python
def crt(eq):
    p, res = 1, 0
    for rem, md in eq:
        p *= md
    for rem, md in eq:
        pp = p // md
        res = (res + rem*extEuclid(pp, md)[1]*pp) % p
    return res
```

Fraction Binary Search

Given f and N, finds the smallest fraction $p/q \in [0, 1]$ such that $f(p/q)$ is true, and $p, q \le N$.

```cpp
struct Frac { ll p, q; };
template<class F> Frac fractionBinarySearch(F f, ll N) {
    bool dir = 1, A = 1, B = 1;
    Frac lo{0, 1}, hi{1, 1}; // Set hi to 1/0 to search (0, N]
    if (f(lo)) return lo;
    assert(f(hi));
    while (A || B) {
        ll adv = 0, step = 1; // move hi if dir, else lo
        for (ll si = 0; step; (step *= 2) >>= si) {
            adv += step;
            Frac mid{lo.p * adv + hi.p, lo.q * adv + hi.q};
            if (abs(mid.p) > N || mid.q > N || dir == !f(mid))
                adv -= step; si = 2;
        }
        hi.p += lo.p * adv;
        hi.q += lo.q * adv;
        dir = !dir;
        swap(lo, hi);
        A = B; B = !!adv;
    }
    return dir ? hi : lo;
}
```

Solve Linear System of Equations

Solves $Ax = b$. If there are multiple solutions, an arbitrary one is returned. Returns rank, or -1 if no solutions. Time complexity: $\mathcal{O}(n^2 m)$

```cpp
int solveLinear(vector<vector<double>> A, vector<double> b, vector<double>& x) {
    const double eps = 1e-12;
    int n = A.size(), m = x.size(), rank = 0, br, bc;
    if (n) assert((int)A[0].size() == m);
    vector<int> col(m); iota(all(col), 0);
    for(int i = 0; i < n; i++) {
        double v, bv = 0;
        for(int r = i; r < n; ++r) for(int c = i; c < m; c++)
            if ((v = fabs(A[r][c])) > bv)
                br = r, bc = c, bv = v;
        if (bv <= eps) {
            for(int j = i; j < n; j++)
                if (fabs(b[j]) > eps) return -1;
            break;
        }
        swap(A[i], A[br]);
        swap(b[i], b[br]);
        swap(col[i], col[bc]);
        for(int j = 0; j < n; j++)
            swap(A[j][i], A[j][bc]);
        bv = 1 / A[i][i];
        // for all solutions do: for (ll j = 0; j < n; j++) { if (j != i) continue;
        for(int j = i + 1; j < n; j++) {
            double fac = A[j][i] * bv;
            b[j] -= fac * b[i];
            for(int k = i+1; k < (m); ++k)
                A[j][k] -= fac*A[i][k];
        }
        rank++;
    }
    // for all solutions do:
    // x.assign(m, undefined);
    // for(int i = 0; i < rank; i++) {
    //     for (int j = rank; j < m; j++)
    //         if (fabs(A[i][j]) > eps) goto fail;
    //     x[col[i]] = b[i] / A[i][i];
    //     fail:;
    // }
    x.assign(m, 0);
    for (int i = rank; i--;) {
        b[i] /= A[i][i];
        x[col[i]] = b[i];
```

```
43          for (int j = 0; j < i; j++)
44              b[j] -= A[j][i] * b[i];
45      }
46      return rank;
47 }
```

Matrix Multiplication

```
1 def matmul(a, b):
2     res = [[0] * len(a) for i in range(len(a))]
3     for i in range(len(a)):
4         for j in range(len(a)):
5             for k in range(len(a)):
6                 res[i][j] += a[i][k] * b[k][j]
7     return res
```

Polynomial Roots

Finds the real roots of a polynomial. Time complexity: $\mathcal{O}(n^2 \log(1/\epsilon))$. Usage (solves $x^2 - 3x + 2 = 0$): `poly_roots({{ 2, -3, 1 }},-1e9,1e9)`

```
1 struct Poly {
2     vector<double> a;
3     double operator()(double x) const {
4         double val = 0;
5         for(int i = a.size(); i--;)
6             (val *= x) += a[i];
7         return val;
8     }
9     void diff() {
10        for (size_t i = 1; i < a.size(); i++)
11            a[i - 1] = i * a[i];
12        a.pop_back();
13    }
14 };
15 vector<double> poly_roots(Poly p, double xmin,
       ↪ double xmax) {
16    if (p.a.size() == 2) return { -p.a[0] / p.a[1] };
17    vector<double> ret;
18    Poly der = p;
19    der.diff();
20    auto dr = poly_roots(der, xmin, xmax);
21    dr.push_back(xmin - 1);
22    dr.push_back(xmax + 1);
23    sort(all(dr));
24    for (size_t i = 0; i < dr.size() - 1; i++) {
25        double l = dr[i], h = dr[i + 1];
26        bool sign = p(l) > 0;
27        if (sign ^ (p(h) > 0)) {
28            for (int it = 0; it < 60; it++) {
29                double m = (l + h) / 2, f = p(m);
30                if ((f <= 0) ^ sign) l = m;
31                else h = m;
32            }
33            ret.push_back((l + h) / 2);
34        }
35    }
36    return ret;
37 }
```

Matrix Inverse

Invert matrix A. Returns rank; result is stored in A unless singular (rank < n). Time complexity: $\mathcal{O}(n^3)$

```
1 ll matInv(vector<vector<double>>& A) {
2     ll n = A.size();
3     vector<ll> col(n);
4     vector<vector<double>> tmp(n, vector<double>(n));
5     for (ll i = 0; i < n; i++) {
6         tmp[i][i] = 1;
7         col[i] = i;
8     }
9     for (ll i = 0; i < n; i++) {
10        ll r = i, c = i;
11        for (ll j = i; j < n; j++)
12            for (ll k = i; j < n; j++)
13                if (fabs(A[j][k]) > fabs(A[r][c]))
14                    r = j, c = k;
15        if (fabs(A[r][c]) < 1e-12) return i;
16        A[i].swap(A[r]); tmp[i].swap(tmp[r]);
17        for (ll j = 0; j < n; j++) {
18            swap(A[j][i], A[j][c]);
19            swap(tmp[j][i], tmp[j][c]);
20        }
21        swap(col[i], col[c]);
22        double v = A[i][i];
23        for (ll j = i+1; j < n; j++) {
24            double f = A[j][i] / v;
25            A[j][i] = 0;
26            for (ll k = i+1; k < n; k++)
27                A[j][k] -= f*A[i][k];
28            for (ll k = 0; k < n; k++)
29                tmp[j][k] -= f*tmp[i][k];
30        }
31        for (ll j = i+1; j < n; j++) A[i][j] /= v;
32        for (ll j = 0; j < n; j++) tmp[i][j] /= v;
33        A[i][i] = 1;
34    }
35    for (ll i = n-1; i > 0; --i) {
36        for (ll j = 0; j < i; j++) {
37            double v = A[j][i];
38            for (ll k = 0; k < n; k++)
39                tmp[j][k] -= v*tmp[i][k];
40        }
41    }
42    for (ll i = 0; i < n; i++)
43        for (ll j = 0; j < n; j++)
44            A[col[i]][col[j]] = tmp[i][j];
45    return n;
46 }
```

FFT

`fft(a)` computes $\hat{f}(k) = \sum_x a[x] \exp(2\pi i \cdot kx/N)$ for all k. Useful for convolution: `conv(a, b)=c`, where $c[x] = \sum a[i]b[x - i]$. Rounding is safe if $(\sum a_i^2 + \sum b_i^2) \log_2 N < 9 \cdot 10^{14}$ (in practice 10^{16}; higher for random inputs).

Time complexity: $\mathcal{O}(N \log N)$ with $N = |A| + |B|$ (about $1s$ for $N = 4 \cdot 10^6$)

```cpp
typedef complex<double> C;
void fft(vector<C>& a) {
    int n = a.size(), L = 31 - __builtin_clz(n);
    static vector<complex<long double>> R(2, 1);
    static vector<C> rt(2, 1);  // (^ 10% faster if double)
    for (int k = 2; k < n; k *= 2) {
        R.resize(n); rt.resize(n);
        auto x = polar(1.0L, M_PIl / k);
        for (int i = k; i < 2 * k; i++)

```

ModFFT

`fft(a)` computes $\hat{f}(k) = \sum_x a[x] g^{xk}$ for all k, where $g = \text{root}^{(M-1)/N}$. N must be a power of 2.

For conv, M should be of the form $2^a b + 1$, and the convolution result should have size at most 2^a. Inputs must be in $[0, M)$.

```cpp
constexpr ll M = 998244353, root = 62;
ll modpow(ll b, ll e) {
    ll ans = 1;
    for (; e; b = b * b % M, e /= 2)
        if (e & 1) ans = ans * b % M;
    return ans;
}
void fft(vector<ll> &a) {
    ll n = a.size(), L = 31 - __builtin_clz(n);
    static vector<ll> rt(2, 1);
    for (static ll k = 2, s = 2; k < n; k *= 2, s++) {
        rt.resize(n);
        ll z[] = {1, modpow(root, M >> s)};
        for (ll i = k; i < 2 * k; i++)
            rt[i] = rt[i / 2] * z[i & 1] % M;
    }
    vector<ll> rev(n);
    for (ll i = 0; i < n; i++)
        rev[i] = (rev[i / 2] | (i & 1) << L) / 2;
    for (ll i = 0; i < n; i++)
        if (i < rev[i])
            swap(a[i], a[rev[i]]);
    for (ll k = 1; k < n; k *= 2)
        for (ll i = 0; i < n; i += 2 * k) for (ll j = 0; j < k; j++) {
            ll z = rt[j + k] * a[i + j + k] % M, &ai = a[i + j];
            a[i + j + k] = ai - z + (z > ai ? M : 0);
            ai += (ai + z >= M ? z - M : z);
        }
}
vector<ll> conv(const vector<ll> &a, const vector<ll> &b) {
    if (a.empty() || b.empty()) return {};
    ll s = (ll)(a.size() + b.size()) - 1;
    ll B = 32 - __builtin_clz(s);
    ll n = 1 << B;

    fft(out);
    return { out.begin(), out.begin() + s };
}
```

Simplex

Solves a general linear maximization problem: maximize $c^T x$ subject to $Ax \le b, x \ge 0$.

Returns -inf if there is no solution, inf if there are arbitrarily good solutions, or the maximum value of $c^T x$ otherwise.

The input vector is set to an optimal x (or in the unbounded case, an arbitrary solution fulfilling the constraints).

Numerical stability is not guaranteed. For better performance, define variables such that $x = 0$ is viable.

vvd A = {{1,-1}, {-1,1}, {-1,-2}}; vd b = {1,1,-4}, c = {-1,-1}, x; T val = LPSolver(A, b, c).solve(x);

$O(NM * \#pivots)$, where a pivot may be e.g. an edge relaxation. $O(2^n)$ in the general case.

```cpp
typedef double T; // long double, Rational, double + mod<P>...
typedef vector<T> vd;
typedef vector<vd> vvd;
#define rep(i, a, b) for(int i = a; i < (b); ++i)

```

Spherical Distance

```
1 double sphericalDistance(double f1, double t1,
2         double f2, double t2, double radius) {
3     double dx = sin(t2)*cos(f2) - sin(t1)*cos(f1);
4     double dy = sin(t2)*sin(f2) - sin(t1)*sin(f1);
5     double dz = cos(t2) - cos(t1);
6     double d = sqrt(dx*dx + dy*dy + dz*dz);
7     return radius*2*asin(d/2);
8 }
```

Returns the shortest distance on the sphere with radius radius between the points with azimuthal angles (longitude) f1 (ϕ_1) and f2 (ϕ_2) from x axis and zenith angles (latitude) t1 (θ_1) and t2 (θ_2) from z axis (0 = north pole). All angles measured in radians. The algorithm starts by converting the spherical coordinates to cartesian coordinates so if that is what you have you can use only the two last rows. dx*radius is then the difference between the two points in the x direction and d*radius is the total distance between the points.

Strings

Manacher

For each position in a string, computes p[0][i] = half length of longest even palindrome around pos i, p[1][i] = longest odd (half rounded down). Time: O(N)

```
1  #define rep(i, a, b) for(int i = a; i < (b); ++i)
2  array<vector<int>, 2> manacher(const string& s) {
3      int n = s.size();
4      array<vector<int>,2> p = {vector<int>(n+1),
       ↪ vector<int>(n)};
5      rep(z,0,2) for (int i=0,l=0,r=0; i < n; i++) {
6          int t = r-i+!z;
7          if (i<r) p[z][i] = min(t, p[z][l+t]);
8          int L = i-p[z][i], R = i+p[z][i]-!z;
9          while (L>=1 && R+1<n && s[L-1] == s[R+1])
10             p[z][i]++, L--, R++;
11         if (R>r) l=L, r=R;
12     }
13     return p;
14 }
```

Polynomial Hash

```
1  using lll = __int128_t;
2  ll P = 12233720368547789LL;
3  ll B = 260;
4  struct PolyHash {
5      vector<ll> hashes, ex;
6      PolyHash(const string& s) : hashes(s.size() +
       ↪ 1), ex(s.size() + 1) {
7          hashes[0] = 1; ex[0] = 1; ex[1] = B;
8          for (size_t i = 0; i < s.size(); i++) {
9              hashes[i + 1] = ((hashes[i] * B) % P +
       ↪ s[i] + 1) % P;
10             ex[i + 1] = (ex[i] * B) % P;
11         }
12     }
13     ll hash(ll lo, ll hi) {
14         return ((lll)hashes[hi] - (lll)hashes[lo] *
       ↪ (lll)ex[hi - lo] % P + P) % P;
15     }
16 };
```

Aho Corasick

Aho-Corasick automaton, used for multiple pattern matching.
Initialize with AhoCorasick ac(patterns); the automaton start node will be at index 0.
find(word) returns for each position the index of the longest word that ends there, or -1 if none.
findAll(−, word) finds all words (up to $N\sqrt{N}$ many if no duplicate patterns)
that start at each position (shortest first).
Duplicate patterns are allowed; empty patterns are not.
To find the longest words that start at each position, reverse all input.
For large alphabets, split each symbol into chunks, with sentinel bits for symbol boundaries.
Time: construction takes $O(26N)$, where $N =$ sum of length of patterns.
find(x) is $O(N)$, where N = length of x. findAll is $O(NM)$.

```
1  #define rep(i, a, b) for(int i = a; i < (b); ++i)
2  #define sz(x) (int)(x).size()
3  struct AhoCorasick {
4      enum {alpha = 26, first = 'A'}; // change this!

66          return res;
67      }
68 };
```

Suffix tree

Ukkonen's algorithm for online suffix tree construction.
Each node contains indices [l, r) into the string, and a list of child nodes.
Suffixes are given by traversals of this tree, joining [l, r) substrings.
The root is 0 (has l = -1, r = 0), non-existent children are -1.
To get a complete tree, append a dummy symbol – otherwise it may contain
an incomplete path (still useful for substring matching, though).

```
1  #define rep(i, a, b) for(int i = a; i < (b); ++i)
2  #define sz(x) (int)(x).size()
3  struct SuffixTree {
4      enum { N = 200010, ALPHA = 26 }; // N ~ 2*maxlen+10
5      int toi(char c) { return c - 'a'; }
6      string a; // v = cur node, q = cur position
7      int t[N][ALPHA],l[N],r[N],p[N],s[N],v=0,q=0,m=2;
8
9      void ukkadd(int i, int c) { suff:
10         if (r[v]<=q) {
11             if (t[v][c]==-1) { t[v][c]=m;  l[m]=i;
12                 p[m++]=v; v=s[v]; q=r[v];  goto suff; }
13             v=t[v][c]; q=l[v];
14         }
15         if (q==-1 || c==toi(a[q])) q++; else {
16             l[m+1]=i;  p[m+1]=m;  l[m]=l[v];  r[m]=q;
17             p[m]=p[v];  t[m][c]=m+1;  t[m][toi(a[q])]=v;
18             l[v]=q;  p[v]=m;  t[p[m]][toi(a[l[m]])]=m;
```

```
19          v=s[p[m]];   q=l[m];
20          while (q<r[m]) { v=t[v][toi(a[q])];   q+=r[v]-l[v]; }
21          if (q==r[m])  s[m]=v;  else s[m]=m+2;
22          q=r[v]-(q-r[m]);  m+=2;  goto suff;
23        }
24      }
25

```

Estimates

$\sum_{d|n} d = O(n \log \log n)$.

The number of divisors of n is at most around 100 for $n < 5e4$, 500 for $n < 1e7$, 2000 for $n < 1e10$, 200 000 for $n < 1e19$.

Number of ways of writing n as a sum of positive integers, disregarding the order of the summands.

$$p(0) = 1, p(n) = \sum_{k \in \mathbb{Z} \setminus \{0\}} (-1)^{k+1} p(n - k(3k-1)/2)$$

$$p(n) \sim 0.145/n \cdot \exp(2.56\sqrt{n})$$

n	0	1	2	3	4	5	6	7	8	9	20	50	100
$p(n)$	1	1	2	3	5	7	11	15	22	30	627	~2e5	~2e8
